

# PATTERNS OF ORGANIC REACTION MECHANISMS

## ORGANIC CHEMISTRY LEGEND

### Arrows

$A \rightarrow B$  A reacts to give B

$A \rightleftharpoons B$  A is in equilibrium with B

$A \Rightarrow B$  A is made from B

$A \leftrightarrow B$  A and B are resonance structures

$A \cdot \rightarrow B$  A collides with B; the 2 electrons from A create a new bond with B

$A \cdot \rightarrow B$  A collides with B; the 1 electron from A creates a new bond with B

$A-B \rightarrow$  The A and B bond breaks; the 2 electrons become a lone pair on B

$A-B \rightarrow$  The A and B bond breaks; 1 electron moves to A and 1 electron moves to B

Note: None of the arrows above represent the movement of A or B.

### Bonds and Electrons

$\overset{\ominus}{\text{O}}:$  formal charge, negative  
2 electrons, non-bonding, lone pair

$\text{Me}$  2 electrons, bonding

Methyl or  $\text{CH}_3$

away from you  $\leftarrow$  towards you

$\text{H}_2\text{N}$  either towards or away

is the same as  $\text{H}_3\text{C}$

implicit carbon and hydrogen atoms explicit carbon and hydrogen atoms

$\delta^-$  partially negative  $\delta^+$  partially positive

$\ddagger$  These square brackets and  $\ddagger$  mean that the structure inside is a transition state.

partially formed or partially broken bond

### Common Abbreviations

—Me methyl — $\text{CH}_3$

—Et ethyl — $\text{CH}_2\text{CH}_3$

—Ph phenyl 

Nu / Nu<sup>-</sup> / Nuc nucleophile  
E / E<sup>+</sup> electrophile

R any group, generic

LG leaving group (e.g. bromine, chlorine)

EWG electron withdrawing group (e.g. ester)

EDG electron donating group (e.g. hydroxyl)

The *patterns of mechanisms* approach organizes organic chemistry reactions by their governing mechanism and uses patterns of reactivity.

## NUCLEOPHILES

$\sigma$  electrophiles,  
empty orbitals  
Electronically  
deficient sites

$\sigma$  electrophiles,  
single bonds  
Electrophilic  
 $\sigma$  or sigma bonds

$\pi$  electrophiles  
Electrophilic  
double bonds  
( $\pi$  or pi bonds)

$\sigma$  nucleophiles,  
lone pairs  
Nucleophilic  
non-bonding  
electrons

$\sigma$  nucleophiles,  
single bonds  
Nucleophilic  
 $\sigma$  or sigma bonds

$\pi$  nucleophiles  
Nucleophilic  
double bonds  
( $\pi$  or pi bonds)

## ELECTROPHILES

The uOttawa curriculum aims to help students become fluent in organic chemistry's language by mastering the following learning outcomes:

1: Draw the products, given the starting materials and curved arrows.

2: Add curved arrows, given the starting materials and products.

3: Add curved arrows and predict the products, given the starting materials.

# ORGANIC CHEMISTRY LEGEND

## Arrows

A → B A reacts to give B

A ⇌ B A is in equilibrium with B

A ⇒ B A is made from B

A ↔ B A and B are resonance structures

A → B A collides with B; the 2 electrons from A create a new bond with B

A → B A collides with B; the 1 electron from A creates a new bond with B

A—B The A and B bond breaks; the 2 electrons become a new bond to B or a lone pair on B

A—B The A and B bond breaks; 1 electron moves to A and 1 electron moves to B

Note: None of the arrows above represent the movement of A or B.

## Bonds and Electrons

↖ ↗ formal charge, negative  
↖ ↗ 2 electrons, non-bonding, lone pair

↔ 2 electrons, bonding

Me Methyl or CH<sub>3</sub>

↖ ↗ away from you ↖ ↗ towards you

NH<sub>2</sub> OH either towards or away

is the same as  
implicit carbon and hydrogen atoms  
explicit carbon and hydrogen atoms

partially negative  
partially positive

These square brackets and ‡ mean that the structure inside is a transition state.  
partially formed or partially broken bond

## Common Abbreviations

—Me methyl —CH<sub>3</sub>  
—Et ethyl —CH<sub>2</sub>CH<sub>3</sub>  
—Ph phenyl

Nu / Nu<sup>-</sup> / Nuc nucleophile  
E / E<sup>+</sup> electrophile

R any group, generic  
LG leaving group (e.g. bromine, chlorine)  
EWG electron withdrawing group (e.g. ester)  
EDG electron donating group (e.g. hydroxyl)

# PATTERNS OF ORGANIC REACTION MECHANISMS

The *patterns of mechanisms* approach organizes organic chemistry reactions by their governing mechanism and uses patterns of reactivity.
